extracellular products are used to raise a protective or therapeutic immune response against Mycobacterium, specifically M. tuberculosis. The immunedominant epitopes can also be used (typically in cutaneous hypersensitivity test) to detect an immune response to vaccination. Preparation of the agent does not require selection of the most immunogenic products, so large scale production and purification are easy, resulting in a consistent, standardised formulation, having lower toxicity than killed or attenuated vaccines. The agents provide a rapid and effective response (including a strong cell-mediated component) and are safe even in immunocompromised subjects. They prevent development of an opsonising humoral response that might spread intracellular pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine composed of major extracellular prods. of Mycobacterium - used promote immune response to various Mycobacterium pathogens, such as M. tuberculosis, M. bovis, M. leprae, etc. in humans, cattle, sheep, etc.

Claim 13; Page 103; 123pp; English

The sequences given in AAR85680-86 represent N-terminal peptides from majorly abundant extracellular products (MAPS) produced by M. tuberculosis which were used in the vaccinating agent of the invention. MAPS constitute approx. 90% of all of the proteins released by M. tuberculosis in culture. MAPS can be used to immunise a host animal, and due to their release from M.tuberculosis when it infects the host, they are presented to the host immune system at high frequency. Due to their profuse and continual presentation to the infected host's immune system, the most prevalent bacterial extracellular products provoke a vigorous immune response largely irrespective of their individual molecular immunogenic characteristics. The vaccinating agent may be used to provide immunity against M. tuberculosis, M.bovis, M.marinum, C. M.kansasii, M.aviumintracellulare, M.fortuitum, M.chelonei, M. scrofulaceum, M.leprae, M. africanum, M. ulcerans, and M.microti in humans, cats, dogs, cattle, sheep, horses and pigs ö Vaccine; vaccinating agent; M.tuberculosis; pathogen; bacteria; virus; fungus; protozoan; HIV. Harth G;

Horwitz MA,

A vaccinating agent for promoting an immune response in a mammal against Mycobacterium pathogens comprises at least one immunodominant epitope of

```
At least one majorly abundant extracellular protein, i.e. the
M. tubberculosis 110, 80, 71, 58, 45, 32A, 32B, 30, 24, 23.5, 23, 16, 14 or
12 kD proteins, or their analogues, homologues and subunits. The present
sequence represents the N-terminal amino acid sequence of the 16 KD
protein. The N-terminal amino acid sequences of the major abundant
extracellular products were determined to provide structural data and to
uncover possible relationships between the proteins. The vaccinating
agents are used to protect against (or to treat existing) infections by
Mycobacterium (especially M. tuberculosis) while the epitopes can also be
used to detect presence of an immune response to a Mycobacterium
pathogen. The vectors, containing the DNA for the extracellular proteins,
are used to transform cells for production of recombinant DNA molecules.
More generally the DNA from other pathogens can be used in vaccines, e.g.
against other bacteria, viruses, fungi and protozoa. Since different
combinations of DNA can be used, a wide range of effective compositions
combinations of DNA can be used, a wide range of effective compositions
found on infected cells during the infection, regardless of the strength
or specificity of the immune response against the antigens most often
for specificity of the immune response are easy to produce
and less toxic than known killed or attenuated vaccines, so can be given
to immunocompromised subjects, e.g. those with HIV infection

New vaccine, useful for promoting an immune response against infectious pathogens of the genus Mycobacterium in a mammalian host.

Example 2; Page 13; 82pp; English

The invention describes a vaccine for promoting an immune response, in a mammalian host, against infectious pathogens of the genus Mycobacterium,

```
ö
comprising at least 1 immunodominant epitope of at least one majority abundant extracellular product comprising Mycobacterium tuberculosis 110, 80, 71, 58, 45, 32A, 32B, 30, 23, 5, 23, 16, 14, 12 KD protein or their analogues, homologues or subunits. The proteins and polypeptides of their anvention are useful in gene therapy and treatment of diseases caused by Mycobacterium such as tuberculosis. This sequence represents an N-terminal peptide from a Mycobacterium tuberculosis extracellular protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel nucleic acid encoding an abundant extracellular protein of Mycobacterium tuberculosis useful as vaccines for generating protective or therapeutic immune response against viral, bacterial, fungal and protezoal infections. They are also used as immunotherapeutic agents. The present sequence is M. tuberculosis strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A nucleic acid encoding an abundant extracellular protein of Mycobacterium tuberculosis useful as vaccines for generating protective or therapeutic immune response against viral, bacterial, fungal or protozoal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "This sequence is stated to be the same as that shown as SEQ ID NO: 22 in sequence listing of the specification"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A vaccinating agent for promoting an immune response in a mammal against Mycobacterium pathogens comprises at least one immunodominant epitope of at least one majorly abundant exacellular protein, i.e. the M.tuberculosis 110, 80, 71, 58, 45, 32A, 32B, 30, 24, 23.5, 23, 16, 14 or 12 kD proteins, or their analogues, homologues and subunits. The present expresents the N-terminal amino acid sequence of the 16 kD protein. The N-terminal amino acid sequence of the major abundant extracellular products were determined to provide structural data and to uncover possible relationships between the proteins. The vaccinating agents are used to protect against (or to treat existing) infections by Mycobacterium (especially M.tuberculosis) while the epitopes can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccines derived from M.tuberculosis major abundant extracellular protectins - are easy to prepare and less toxic than conventional killed or attenuated vaccines, useful for protecting against or treating Mycobacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used to detect presence of an immune response to a Mycobacterium pathogen. The vectors, containing the DNA for the extracellular proteins, are used to transform cells for production of recombinant DNA molecules. More generally the DNA from other pathogens can be used in vaccines, e.g. against other bacteria, viruses, fungi and protozoa. Since different combinations of DNA can be used, a wide range of effective compositions
                                                                                                                                                                                                                                                                                                                                                                                                     Vaccine; vaccinating agent; M.tuberculosis; pathogen; bacteria; virus; fungus; protozoan; HIV.

ö
most often
can be produced. They generate a response against the antigens most often found on infected cells during the infection, regardless of the strength or specificity of the immune response. The vaccines are easy to produce and less toxic than known killed or attennated vaccines, so can be given to immunocompromised subjects, e.g. those with HIV infection

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

I Empirical analysis of transcriptional activity in the Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Science 302:842-846(2003).

-: SUBCELLULAR LOCATION: Mitochondrial matrix.
-: SIMILARITY: Belongs to peptidase family $16.
-:- CAUTION: Ref.1 sequence differs from that shown due to frameshifts in positions 718, 724 and 726.
-:- CAUTION: Ref.2 sequence differs from that shown due to erroneous gene model prediction.

associated with feeding behavior.";
J. Grom. 2712.66115-26319 (1996).
C. I. FUNCTION: Receptor for neuropeptide Y and peptide YY. The activity of this receptor is mediated by G proteins that inhibit adenylate cyclass activity. Seems to be associated with food intake. Could be involved in feeding disorders.
C. STRILARITY: Belongs to family 1 of G-protein coupled receptors.
Highest to tachykinins receptors.

Nature 423:81-86(2003).

-!- FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.

-!- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alphanormore.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

-I- FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.

-I- CATALYIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-D-ribose I-diphosphate.
-I- PATHWAY: Purine salvage.
-I- SUBJUIT: Homodimer (By similarity).
-I- SUBCELLULAR LOCATION: Cytoplasmic.
-I- SUBCELLULAR LOCATION: Cytoplasmic.
-I- SIMILARITY: Belongs to the purine/pyrimidine
-I- phosphoribosyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Ribose-phosphate pyrophosphokinase (EC 2.7.6.1) (RPPK) (Phosphoribosyl pyrophosphate synthecase) (P-Rib-PP synthetase).
PRS OR PRSA OR ML0248.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nature 409:1007-1011(12001).

-!- CATALYTIC ACTIVITY: ATP + D-ribose 5-phosphate = AMP + 5-phospho-
alpha-D-ribose 1-diphosphate.

-!- COFACTOR: Binds 1 magnesium ion per subunit (By similarity).

-!- COFACTOR: Binds 1 magnesium ion per subunit (By similarity).

-!- PATHWAY: Utilized by both the de novo and the salvage pathways by which endogenously formed or exogenously added pyrimidine, purine, or pyridine bases are converted to the corresponding ribonucleoside monophosphates.

-!- SUBCELBURLAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: Belongs to the ribose-phosphate pyrophosphokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cole S.T., Eiglmeier K., Parkhill J., James K.D., Thomson N.R., Wheeler P.R., Honore N., Garnier T., Churcher C., Harris D., Mungall K., Basham D., Brown D., Chillingworth T., Connor R., Davies R.M., Devlin K., Duthoy S., Feltwell T., Fraser A., Hamlin N., Holroyd S., Hornsby T., Jagels K., Lacroix C., Maclean J., Moule S., Murphy L., Oliver K., Quail M.A., Rajandream M.A., Rutherford K.M., Ruther S., Seegar K., Simon S., Simonds M., Skelton J., Squares R., Barrell B.G.;

I composition transport (or KDP) system, which catalyzes the hydrolysis of ATP coupled with the exchange of hydrogen and potassium ions (By similarity).

C -1- CATALYTIC ACTIVITY: ATP + H(2)O + K(+) (Out) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SPECIES=M.Luberculosis, STRAIN=H37Rv;

The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine candidate peptides. The invention also relates to a method for the additional modernity of the vaccine candidate peptides well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine tuberculosis (anti-Mtb) influence influencing an anti-Mycobacterium mammalian subject preferably humans. They are used for immunising a manimalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide
 New vaccine for immunizing a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis.

The polypeptide is an immunological quivalent to MPT64, conferring immunity to tuberculosis caused by bacteria belonging to the tuberculosis complex (Mycobacterium tuberculosis, Mycobacterium afficianum and Mycobacterium bovis). Thus, the protein can be used in a vaccine composition against tuberculosis. The vaccine confers greatly increased immunity to tuberculosis. The vaccine confers greatly increased responses in previously vaccinated people. The protein may also be used in a diagnostic kit where it elicits a delayed type hyeresneitivity reaction in animals with active tuberculosis, but not in previously vaccinated animals. (Updated on 25-MAR-2003 to correct PN field.)
 Diagnostic skin test for tuberculosis (TB) eliminating positive response in vaccinated animals - also polypeptide(s) and DNA of mycobacterial protein MPT64 and vaccines against TB.

A vaccinating agent for promoting an immune response in a mammal against Mycobacterium pathogens comprises at least one majorly abundant extracellular protein, i.e. the M.tuberculosis 110, 80, 71, 58, 45, 32A, 32B, 30, 21, 23.5, 23, 16, 14 or 12 kD proteins, or their analogues, homologues and subunits. The present sequence represents the 23.5 kD protein. The vaccinating agents are used to protect against (or to treat existing) infections by Mycobacterium (especially M. tuberculosis) while the spitopes can also be used to detect presence of an immune response to a Mycobacterium pathogen. The vectors, containing the DNA for the extracellular proteins, are used to transform cells for production of extracellular proteins, are used to transform cells for production of extracellular proteins, and used to transform cells for production of recombinant DNA molecules. More generally the DNA from other pathogens can be used in vaccines, e.g. against other bacteria, viruses, fungi and protozoa. Since different combinations of DNA can be used, a wide range against the antigens most often found on infected cells during the infection, regardless of the strength or specificity of the immune infection attenuated vaccines, so can be given to immunocompromised subjects, e.g. those with HIV infection
 Vaccines derived from M.tuberculosis major abundant extracellular proteins - are easy to prepare and less toxic than conventional killed or attenuated vaccines, useful for protecting against or treating Mycobacterial infections

This represents a Mycobacterium tuberculosis 23.5 kD protein. The invention provides an agent for vaccinating mammals against Mycobacterium. The agent comprises at least one of the major abundant Mycobacterium. The agent comprises at least one of the major abundant corrections of M. tuberculosis, or at least 1 of their immunodominant epitopes and interleukin-12 (II-12) or MNF9 as adjuvants. The agent containing the mucleic acid encoding the extracellular products are used to raise a protective or therapeutic immune response against of production, specifically M. tuberculosis. The immunodominant epitopes can also be used (typically in a cutaneous hypersensitivity test) to detect an immune response to vaccination. Preparation of the agent does not require selection of the most immunogenic products, so large scale production and purification are easy, resulting in a consistent, standardised formulation, having lower toxicity than killed or attenuated vaccines. The agents provide a rapid and effective response (including a strong cell-mediated component) and are safe even in immunocompromised subjects. They prevent development of an opsonising humoral response that

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TDRail. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used a diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis
 The invention relates to a novel nucleic acid encoding an abundant extracellular protein of Mycobacterium tuberculosis useful as vaccines for generating protective or therapeutic immune response against viral, bacterial, fungal and protozoal infections. They are also used as immunotherapeutic against. The present sequence is M. tuberculosis strain Erdman extracellular protein

 The present sequence is that of the Mycobacterium tuberculosis (Mtb) strain H37Rv gene Rv1886c product, designated MPT64. This is one of 31 immunodominant secreted or cytosolic Mtb proteins of strain H37Rv (see AAMS0729-59) discovered through the use of 2-dimensional liquid phase electrophoresis coupled with an in vitro interferon-gamma assay and liquid chromatography-mass spectrometry. The immunogens stimulate a strong interferon-gamma response from T cells of M. tuberculosis infected mice. The invention provides vaccine compositions for boosting immunity to mycobacteria when administered in mid-life to a subject who has been vaccinated neonatally or in early childhood with BCG and in whom protective immunity has waned. The vaccine compositions comprise 1 or more of the 31 purified immunogenic proteins. When used as immunogens, the secreted Mtb proteins lack the secreted signal sequence. A preferred protein is Ag85A (see AAMS0759), the secreted product of the Rv3084v gene
Vaccine for boosting immunity to mycobacteria when administered in mid-
life in a subject who has been vaccinated in childhood with Bacillus
Calmette-Guerrin, has purified proteins from mycobacterium tuberculosis.

 This polypeptide comprises Mycobacterium tuberculosis soluble antigen tuberculosis strain H37Ra expression library with rabbit anti-sera raised against M. tuberculosis supermatant. ThRall has previously been identified in M. tuberculosis. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis claimed are methods and patient using the above polypeptides, antibodies, or oligonuclectide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-OCT-2003 to standardise OS field)

nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce profiferation of, or cytokine secretion by. T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAZ19460 and AAX1940 to AAX19225 are used in the exemplification of
 New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid mibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide (b) producing the polypeptide, (6) inhibiting cellular proliferation or the activity of a gene in an operon required by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide, (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts, (9) manufacturing an entibiotic (10) profiling a compound; a activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the target of a compound caids required for cellular proliferation to isolate candidate molecules for rational

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

### ALIGNMENTS

The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine andidate peptides. The invention also relates to a method for identifying Mtb vaccine candidate peptides as well as vaccines comprising these candidate peptides. Vaccines of the invention and Mtb vaccine these candidate peptides was useful for inducing an anti-Mycobacterium tuberculosis (anti-Mtb) immune response by raising anti-Mycobacterium mammalian subject preferably humans. They are used for immunishing a Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide New vaccine for immunizing a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. Mycobacterium tuberculosis, Mtb peptide; antibacterial; vaccine; infection; anti-Mtb immune response. Mycobacterium tuberculosis (Mtb) peptide #78 AAE12293 standard; peptide; 20 AA. This sequence represents the Mycobacterium bovis MPB70. This sequence was used to create a pool of T-cell epitope peptides (see AAW12046-W12067). T regions of a protein) which bind to T-cell antigen receptors in regions of a protein) which bind to T-cell antigen receptors in conjugation with MMF proteins. The epitope sequences shown in AAW11953-W11956 were the most antigenic peptides obtained from pools of peptides created from the HIV sf2 gpl20 (AAW11953-W11960), herpes simplex virus antigen gpl2 (AAW11961-W11969), and tetanus toxoid (AAW11970-W11976). The epitopes can be used in methods for detecting exposure of a mammal or bird to an antigen. The peptides can also be used in a method for detectmining T-cell epitopes specific for an antigen. These methods allow for the identification of T-cell determinants. The T-cell epitope peptides can be used in a wacton for determining T call epitopes specific for an antigen. These methods allow for the identification of T-cell determinants. The T-cell epitope peptides can be used in a waccine for inducing an immune response in a bird or mammal. The vaccine also contains a B-cell antigen, preferably herpes simplex virus gp2 (see AAW12068) or HIV sf2 gp120 (see AAW11977), and a carrier
 T cell epitope peptide(s) - useful for detecting exposure of a subject to an antigen or pathogen, and in vaccines for birds and mammals.

 Diagnosis of mycobacterium bovis infection - using antibodies specific to MPB-70 protein of M bovis.
 The MPB-70 protein can be detected by specific antibodies or by a cell-mediated immune response against it, to diagnose M.bovis infection. The protein is produced by chromatofocussing of a M.bovis ANS culture filtrate. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.)

 DNA vectors contg. MPB70 gene promoter region - used as expression system for actinomycetes and related organisms, esp. mycobacterium bovis BCG.
 Gene product was isolated from MPB70 gene of Mycobacterium bovis BCG. Product is encoded by a construct expressing hetrologous antigenic genes for development of vaccines. Vaccines may be created which will induce a cell-mediated immune response, diagnostically distinguishable from wild type infection by Mycobacteria, eg. M.bovis, M.tuberculosis, M.Lprae etc. (Updated on 25-MAR-2003 to correct PA field.)
 This sequence corresponds to the MPT70 protein from Mycobacterium tuberculosis. The invention relates to the introduction of protein glycosylation motifs, into other proteins, especially when expressed in an actinomycete host cell, in order to improve their immunogenicity and hence their use in e.g. vaccines. The polypeptide is used to immunise a mammal against infection by M. tuberculosis

The present sequence represents a 220 amino acid mpt83 gene product. The present sequence represents a 220 amino acid mpt83 gene product. The protein can be used in vaccines to protect against Mycobacterium tuberculosis infection or for antibody production. The antibodies are useful as diagnostic agents, to detect M. tuberculosis infection in a sample. The mpt83 gene promoter, glycosylation, lipoylation and secretion the transformation of cells e.g. to produce glycosylated or lipoylated products which can be regulated by macrophage factors
 This sequence corresponds to the MPT83 protein from Mycobacterium tuberculosis. The invention provides heat-killed Mycobacterium vaccae, or recombinant
M. vaccae proteins. The M. vaccae proteins may be employed to activate relis and natural killer cells, to stimulate the production of cytokines, contained the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology.

Pharmaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, prevention, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis, leprosy, sarcoidosis and lung cancers, and disorders of the skin such as poriasis, atopic dermatitis, eczema, allergic contact dermatitis, allopedia areata, and skin cancers such as basal carcinoma, squamous cell carcinoma and melanoma

 SUBCELLULAR LOCATION: Secreted.

MISCELLANBOUS: PRODUCED IN HIGH CONCENTRATION BY BCG TOKYO,
MOREAU, RUSSIA AND SWEDEN (HIGH-PRODUCER SUBSTRAINS), WHEREAS IN
BCG PASTEUR, COPENHAGEN AND TICE (LOW-PRODUCER SUBSTRAINS) IT IS
DETECTED AT 1% (W/W) OR LESS OF THE CONCENTRATION OF BCG TOKYO.

ATTRIBUTED TO DIFFERENTIAL TRANSCIPTION BFFICIENCIES.
SIMILARITY: CORTAINS I PASI domain.

Eliochemical, molecular, and physiological aspects of plant

Eliochemical, molecular, and physiological aspects of plant

Eliochemical, molecular, and physiological aspects of plant

University of Geneva, Lubiin and Geneva (1991).

-I- FUNCTION: Removal of H(2)O(2), oxidation of toxic reductants,

bosynthesis and degradation of light, subscrization, auxin

catabolism, response to environmental stresses such as wounding,

pathogen attack and oxidative stress. These functions might be

dependent on each isosyme/isoform in each plant tissue.

-I- CATALYTIC ACTIVITY: Donor + H(2)O(2) = oxidized donor + 2 H(2)O.

-I- COFACTOR: Binds 1 heme B (iron-protoporphyrin IX) group and 2

calcium ions per subunit.

-I- SIMILARITY: Belongs to the peroxidase family. Classical plant

(Class III) peroxidase subfamily.

Bloi., Gham. 279:5385-5388(1998).
-1- FUNCTION: General vesicular transport factor required for interciseral transport in the Golgi stack; it is required for transcytotic fusion and/or subsequent binding of the vesicles to the target membrane. May well act as a vesicular anchor by interacting with the target membrane and holding the vesicular and target membranes in proximity (By similarity).

## ALIGNMENTS

```
The present invention relates to Mycobacterium tuberculosis (Mtb) vaccine candidate peptides. The invention also relates to a method for the candidate perides as well as vaccines comprising these candidate peptides of the invention and Mtb vaccine candidate peptides. Vaccines of the invention and Mtb vaccine tuberculosis (anti-Mtb) inducing an anti-Mycobacterium mammalian subject preferably human. They are used for immunising a manimalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis. The present sequence is a Mtb vaccine candidate peptide
 New vaccine for immunizing a mammalian subject, preferably humans, against infection caused by Mycobacterium tuberculosis.

 Diagnosis of mycobacterium bovis infection - using antibodies specific to MPB-70 protein of M bovis.
 The MPB-70 protein can be detected by specific antibodies or by a cell-mediated immune response against it, to diagnose M.bovis infection. The protein is produced by chromatofocussing of a M.bovis ANS culture filtrate. (Updated on 25-WAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.)

The gene mpt83 encodes the 25 kDa antigen of Mycobacterium tuberculosis. The present sequence represents a 220 amino acid mpt83 gene product. The protein can be used in vaccines to protect against Mycobacterium tuberculosis infection or for antibody production. The antibodies are useful as diagnostic agents, to detect M. tuberculosis infection in a sample. The mpt83 gene promoter, glycosylation, ilpoylation and secretion sequences can be used in recombinant DNA expression systems for use in the transformation of cells e.g. to produce glycosylated or lipoylated products which can be regulated by macrophage factors
 This sequence corresponds to the MPT83 protein from Mycobacterium tuberculosis. The invention relates to the introduction of protein glycosylation motifs, into other proteins, especially when expressed in an actinomycete host call, in order to improve their immunogenicity and hence their use in e.g. vaccines. The polypeptide is used to immunise a mammal against infection by M. tuberculosis

The present invention relates to a method of inhibiting skin inflammation associated with a skin disorder selected from psoriasis, atopic dermatitis, which involves administering a composition containing delipidated and deglycolipidated Mycobacterium vaccae cells or M. vaccae culture filtrate. The skin disorder to be treated may also include alopecia areata, and skin cancers such as basal call carcinoma, aguamous cell carcinoma and melanoma. The composition acts by inhibiting the Th2 immune response. The present sequence is a protein described in the exemplification of the invention

 The invention provides heat-killed Mycobacterium vaccae, or recombinant

W. vaccae proteins. The M. vaccae proteins may be employed to activate T

Cells and natural killer cells, to stimulate the production of cytokines,

cells and natural killer cells, to stimulatory molecules on dendritic cells

and monocytes, and to enhance dendritic cell maturation and function. The

proteins can be expressed by standard recombinant methodology.

Pharmaceutical compositions comprising the proteins or nucleic acid

sequences encoding the proteins can be used for the treatment,

prevention, and detection of disorders including infectious diseases,

immune disorders and cancer. In particular, the compounds and methods are

used for treatment of diseases of the respiratory system, such as

mycobacterial infections, asthma, allergies, tuberculosis, leprosy,

carcoidosis and lung cancers, and disorders of the skin such as

postissis, atopic dermatitis, eccama, allergic contact dermatitis,

alphanaceuricular, and skin cancers such as basal carcinoma, squamous cell

M. Vaccae proteins. The M. Vaccae proteins may be employed to activate T. C. C. Is and natural killer cells, to stimulate the production of cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology.

Denamaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, prevention, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are mycobacterial infections, asthma, allergies, tuberculosis, leprosy, sarcoidosis and lung cancers, and disorders of the skin such as carcinosis, and skin cancers such as basal carcinoma, squamous cell carcinoma and melanoma

 The present invention relates to methods for modulating immune responses by modulating the Notch signalling and Toll-like receptor signalling applayary using compositions comprising mycobacteria antigens (ACC42518-ACC42543 and ABP70878-ABP709303). The methods are useful for modulating immune responses and treating e.g. autoimmune disorders (such as multiple systems; rheumatoid arthritis, Type I diabetes mallitus, psoriasis, systemic lupus erythematosus, scleroderma), allergic disease and graft rejection and also disorders characterised by undesired apoptotic cell
 Methods for modulating immune responses by modulating the Notch signaling and Toll-like receptor signaling pathways, and treating e.g. autoimmune

 The present invention relates to a method of inhibiting skin inflammation descoiated with a skin disorder selected from psoriasis, atopic dermatitis and allergic contact dermatitis, which involves administering a composition containing delipidated and deglycolipidated Mycobacterium vaccae cells or M. vaccae culture filtrate. The skin disorder to be treated may also include alopecia areata, and skin cancers such as basal cell carcinoma, squamous cell carcinoma and melanoma. The composition acts by inhibiting the Th2 immune response. The present sequence is a protein described in the exemplification of the invention
 Immunosuppressive; neuroprotective; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; dermatological; anti-inflammatory; immune response; Notch signalling pathway; autoimmune disorder; Toll-like receptor signalling pathway; antigen; allergy; graft rejection; apoptotic cell death; cell proliferation.
 Gaps
 Inhibiting skin inflammation associated with skin disorder e.g. operiasis, by administering composition comprising delipidated and deglycolipidated Mycobacterium vaccae cells or Mycobacterium vaccae culture filtrate.

Invest. Ophthalmol. Vis. Sci. 38:893-900(1997).

Invest. Ophthalmol. Vis. Sci. 38:893-900(1997).

-!- FUNCTION: BINDS TO TYPE I, II, AND IV COLLAGEN INTERACTIONS.

IN CARTILAGE. MAY BE INVOLVED IN ENDOCHONDEAL BONE FORMATION. MAY PLAY AN IMPORTANT ROLE IN THE MORPHOGENESIS OF CORNEAL TISSUES.

-!- SUBCELLULAR LOCATION: Extracellular. May be associated both with microfibrils and with the cell surface (By similarity).

-!- TISSUE SPECIFICITY: LOCATED PRIMARILY IN THE EPITHELIUM OF NORMAL ADULT CORNEA, IN FETAL STROMAL CELLS, AND BOTH ENDOTHELIUM AND STROMAL ADULT ENDOTHELIUM AND STROMA.

-!- INDUCTION: By TGF-beta.

-!- SIMILARITY: CORTENING CORNEAL WOUNDS. NOT EXPRESSED IN NORMAL ADULT REPORTELIUM AND STROMA.

-!- INDUCTION: By TGF-beta.

-!- SIMILARITY: CORTENING 4 FASI domains.

-!- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 15.
 BY SIMILARITY.

 myogenesis.

DEVELOPMENTAL STAGE: In germ cells, it is present at high levels in spermatogonia and spermatocytes until the pachytene stage, where it falls to undetectable levels. The transient drop at the pachytene stage coincides with the disappearance of the 5.2 kb mRNA and the accumulation of a larger 6.0 kb mRNA. Cocytes accumulate very large amounts of Dmmt1 protein during the growth

 임
 -!- SUBUNIT: Interacts with HDAC1 and with PCNA. Forms a complex with DNAP1 and HDAC2, with direct interaction.
-!- SUBCELLULAR LOCATION: Nuclear; it is nucleoplasmic through most of the cell gycle and associates with replication foci during Sphase. In germ cells: spermatogonia, preleptotene and leptotene aperatocyces all express high levels of nuclear protein, while the protein is not detected in pachytene spermatocyces, despite protein is not detected in pachytene spermatocyces, despite protein is not detected in non-growing occytes, in contrast to the growing occytes. During the growing, the protein is no longer detectable in nuclei but accumulates to very high levels first throughout the cytoplasm. At the time of ovulation, all the protein is cytoplasmic and is actively associated with the occyte cortex. After fecondation, in the preimplantation embryo, the protein remains cytoplasmic and after implantation embryo, the protein remains cytoplasmic and after implantation embryo, the protein remains cytoplasmic and after implantation.
